Data Summarization

Introduction to R for Public Health Researchers

Data Summarization

- Basic statistical summarization
 - mean(x): takes the mean of x
 - sd(x): takes the standard deviation of x
 - median(x): takes the median of x
 - quantile(x): displays sample quantities of x. Default is min, IQR, max
 - range(x): displays the range. Same as c(min(x), max(x))

Some examples

We can use the mtcars and Charm City Circulator datasets to explore different ways of summarizing data.

head(mtcars)

	mpg	cyl	disp	hp	drat	wt	qsec	٧s	\mathtt{am}	gear	carb
Mazda RX4	21.0	6	160	110	3.90	2.620	16.46	0	1	4	4
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.320	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.460	20.22	1	0	3	1

Statistical summarization

```
mean(mtcars$hp)

[1] 146.6875
quantile(mtcars$hp)
```

```
0% 25% 50% 75% 100% 52.0 96.5 123.0 180.0 335.0
```

Statistical summarization

3.44

```
median(mtcars$wt)
[1] 3.325
quantile(mtcars$wt, probs = 0.6)
60%
```

Statistical summarization

t.test(mtcars\$wt)

```
t.test will be covered more in detail later, gives a 95% CI:
```

```
One Sample t-test

data: mtcars$wt
t = 18.6, df = 31, p-value < 2.2e-16
alternative hypothesis: true mean is not equal to 0
95 percent confidence interval:
2.864478 3.570022
sample estimates:
mean of x
3.21725
```

Statistical summarization

Note that many of these functions have additional inputs regarding missing data, typically requiring the na.rm argument.

```
x = c(1,5,7,NA,4,2, 8,10,45,42)
mean(x)

[1] NA
mean(x,na.rm=TRUE)

[1] 13.77778
quantile(x,na.rm=TRUE)

0% 25% 50% 75% 100%
1 4 7 10 45
```

Data Summarization on matrices/data frames

```
• Basic statistical summarization
```

```
rowMeans(x): takes the means of each row of x
colMeans(x): takes the means of each column of x
rowSums(x): takes the sum of each row of x
colSums(x): takes the sum of each column of x
summary(x): for data frames, displays the quantile information
```

Charm City Circulator data

```
Please download the Charm City Circulator data:
```

Subsetting to specific columns

Let's just take columns that represent average ridership:

```
library(dplyr)
circ2 = select(circ, date, day, ends_with("Average"))
head(circ2, 4)
                   day orangeAverage purpleAverage greenAverage
        date
1 01/11/2010
                               952.0
                Monday
2 01/12/2010
                               796.0
                                                 NA
                                                               NA
               Tuesday
3 01/13/2010 Wednesday
                                                               NA
                               1211.5
                                                 NA
4 01/14/2010 Thursday
                               1213.5
                                                 NA
                                                               NA

```

Apply statements

You can apply more general functions to the rows or columns of a matrix or data frame, beyond the mean and sum.

```
apply(X, MARGIN, FUN, ...)
```

X: an array, including a matrix.

MARGIN: a vector giving the subscripts which the function will be applied over. E.g., for a matrix 1 indicates rows, 2 indicates columns, c(1, 2) indicates rows and columns. Where X has named dimnames, it can be a character vector selecting dimension names.

FUN: the function to be applied: see 'Details'.

...: optional arguments to FUN.

Apply statements

```
apply(avgs,2,mean,na.rm=TRUE) # column means
orangeAverage purpleAverage
                             greenAverage bannerAverage
   3033.1611
                  4016.9345
                                1957.7814
                                               827.2685
apply(avgs,2,sd,na.rm=TRUE) # columns sds
orangeAverage purpleAverage greenAverage bannerAverage
    1227.5779
                                 592.8969
                  1406.6544
                                               436.0487
apply(avgs,2,max,na.rm=TRUE) # column maxs
orangeAverage purpleAverage greenAverage bannerAverage
       6926.5
                     8089.5
                                   5094.0
                                                 4617.0
```

Other Apply Statements

- tapply(): 'grouping' apply
- lapply(): 'list' apply [tomorrow]
- sapply(): 'simple' apply [tomorrow]
- Other less used ones...

See more details here: http://nsaunders.wordpress.com/2010/08/20/a-brief-introduction-to-apply-in-r/

tapply()

From the help file: "Apply a function to each cell of a ragged array, that is to each (non-empty) group of values given by a unique combination of the levels of certain factors."

```
tapply(X, INDEX, FUN = NULL, ..., simplify = TRUE)
```

Simply put, you can apply function FUN to X within each categorical level of INDEX. It is very useful for assessing properties of continuous data by levels of categorical data.

tapply()

For example, we can estimate the highest average daily ridership for each day of the week in 1 line in the Circulator dataset.

```
tapply(circ2$daily, circ2$day, max, na.rm = TRUE)

Friday Monday Saturday Sunday Thursday Tuesday Wednesday
5600.75 5002.25 6123.00 3980.25 4820.50 4855.25 4985.00
```

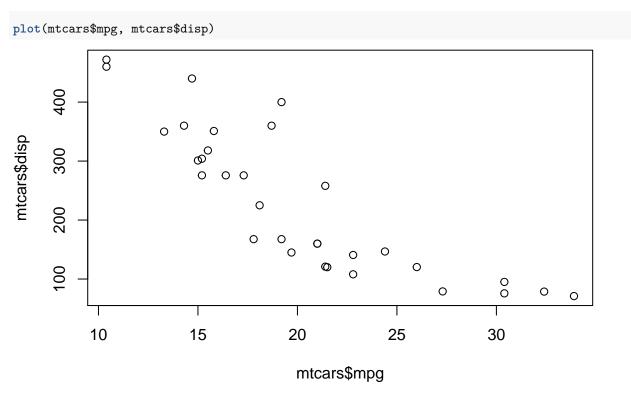

Data Summarization/Visualization

- Basic summarization plots
 - plot(x,y): scatterplot of x and y
 - boxplot(y~x): boxplot of y against levels of x
 - hist(x): histogram of x
 - density(x): kernel density plot of x

Basic Plots

Plotting is an important component of exploratory data analysis. We will review some of the more useful and informative plots here. We will go over formatting and making plots look nicer in additional lectures.

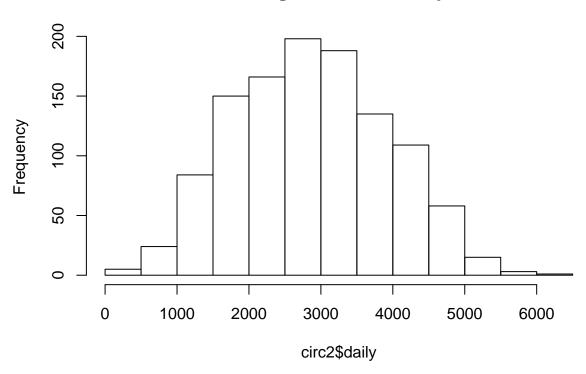

Scatterplot

Histograms

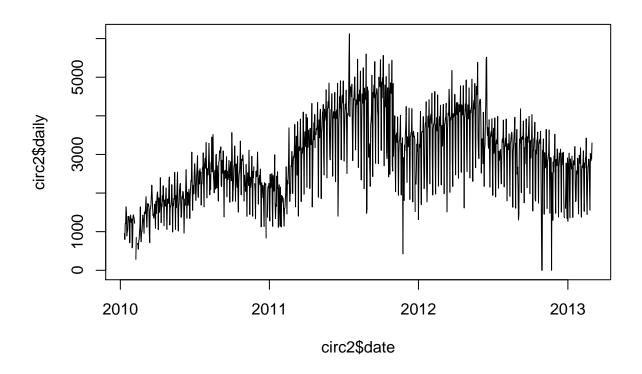

hist(circ2\$daily)

Histogram of circ2\$daily

Plot with a line

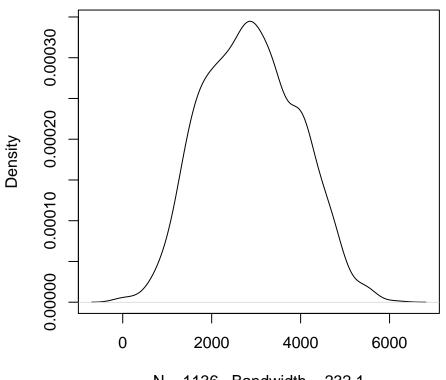

```
type = "l" means a line
library(lubridate)
circ2$date = mdy(circ2$date)
plot(circ2$date, circ2$daily, type = "l")
```

Density

```
## plot(density(circ2$daily))
plot(density(circ2$daily,na.rm=TRUE))
```

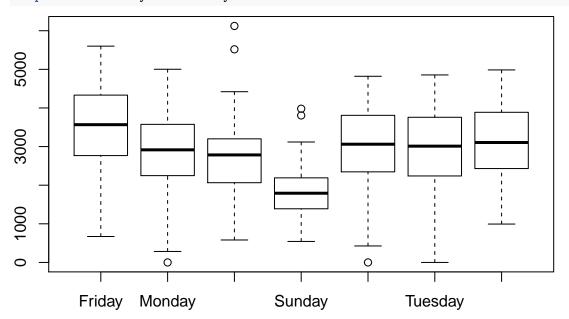

density.default(x = circ2\$daily, na.rm = TRUE)

N = 1136 Bandwidth = 232.1

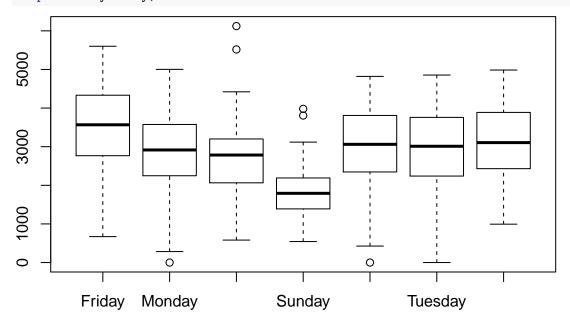

Boxplots

boxplot(circ2\$daily ~ circ2\$day)

Boxplots

boxplot(daily ~ day, data=circ2)

Data Summarization for data.frames

- ullet Basic summarization plots
 - matplot(x,y): scatterplot of two matrices, x and y
 - pairs(x,y): plots pairwise scatter plots of matrices x and y, column by column

Matrix plot

pairs(avgs)
